

IDEATION PHASE

Brainstorm & Idea Prioritization Template

Date	03 October 2026
Team ID	SWTID-2026-4310
Project Name	Implement Client Script & UI Policy (Incident)
Program / Module	ServiceNow System Administrator
Maximum Marks	4 Marks

UI Policy Client Script Testing

Project Overview

This group project focuses on implementing and validating **Client Scripts** and a **UI Policy** on the ServiceNow **Incident** table. The work progresses from field-level UI control to client-side validation and list editing controls.

Current project status: The project screen indicates that the group has not yet been formed and the stories have not yet been assigned. The next project action is to form a team or start the group project individually, then assign the milestone stories.

STEP 1: TEAM GATHERING, COLLABORATION AND SELECT THE PROBLEM STATEMENT

Problem Statement

Problem	Incident forms need controlled field behavior, save-time validation, and safe list editing so that user actions follow the project's defined rules.
Goal	Configure a UI Policy and multiple Client Scripts that enforce the required Incident behavior while providing testable, user-facing validation.
Platform	ServiceNow — Incident table

Project Scope

1	UI Policy Setup	Create a UI Policy on Incident and configure a UI Policy Action for the Urgency field.
2	onChange Client Script	Implement field-change behavior according to the project requirements.
3	onSubmit Client Script	Implement save validation before an Incident form is submitted.
4	onCellEdit Client Script	Control list-edit behavior and prevent invalid list-based updates.
5	Testing & Enforcement	Test mandatory fields, save validation, reverse conditions, list-edit blocking and form-based updates.

STEP 2: BRAINSTORM, IDEA LISTING AND GROUPING

The project activities can be grouped into three functional areas so the team can work systematically.

A. UI CONTROL	• UI Policy on Incident • UI Policy Action • Urgency field behavior • Reverse condition behavior
B. CLIENT-SIDE VALIDATION	• onChange Client Script • onSubmit Client Script • Save validation • Mandatory-field enforcement
C. LIST & FORM TESTING	• onCellEdit Client Script • List-edit blocking • Form-based updates • End-to-end testing

onCellEdit

Test

Configure → Validate → Control → Verify

Milestone Breakdown

Milestone 1	Create UI Policy	Incident table
Milestone 2	Create UI Policy Action	Urgency field
Milestone 3	Create onChange Client Script	Field-change behavior
Milestone 4	Create onSubmit Client Script	Save validation
Milestone 5	Create onCellEdit Client Script	List editing control
Milestone 6	Testing & Enforcement	Mandatory, reverse, list and form tests

STEP 3: IDEA PRIORITIZATION

Prioritization is based on implementation dependency: configuration first, then client-side behavior, followed by integrated testing.

1	UI Policy + UI Policy Action	Foundation	High	Required before meaningful UI behavior can be verified.

2	onChange Client Script	Client behavior	High	Depends on the Incident form and its fields being available.
3	onSubmit Client Script	Save validation	High	Validates behavior at the point of form submission.
4	onCellEdit Client Script	List behavior	Medium	Addresses list-edit scenarios after core form behavior is configured.
5	Testing & Enforcement	Verification	Highest	Confirms all configured behaviors work as intended.

Testing Checklist

Mandatory field enforcement	Confirm required field behavior is enforced.
Form save validation	Verify onSubmit validation before saving.
Reverse condition behavior	Check UI behavior when the condition changes in the opposite direction.
List-edit blocking	Verify invalid list edits are blocked as required.
Form-based updates	Verify updates made through the Incident form behave correctly.

CONFIGURE SCRIPT CONTROL TEST

Expected Project Outcome

A structured Incident configuration in ServiceNow where the UI Policy and Client Scripts work together to control field behavior, validate saves, manage list editing, and provide a clear testing path across the required milestones.
