Team ID	SWTID-2026-4310
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Empathy Map Canvas:

An empathy map captures the behaviours, attitudes, goals and challenges of a user. For this ServiceNow project, the map focuses on a user working with Incident records and the experience created by UI Policies and Client Scripts.

The exercise helps the team understand what the user says, thinks, does and feels while creating, editing and validating an Incident. This directly supports the project activities for UI Policy, UI Policy Action, onChange, onSubmit and onCellEdit Client Scripts.

Project Context

Project activities represented: Create a UI Policy on the Incident table → configure the Urgency UI Policy Action → implement onChange, onSubmit and onCellEdit Client Scripts → test mandatory-field enforcement, save validation, reverse conditions, list-edit blocking and form-based updates.

Reference: Empathy Map Canvas template provided for the project.

Ideation Phase

Empathize & Discover

Project: Implement Client Script & UI Policy (Incident)

Empathy Map Canvas

SAYS • “I need to know which fields are required.” • “I want the Incident to save only when the data is valid.” • “The same rules should work when I edit records from a list.”	THINKS • Am I entering all the required information? • Will the form stop me if something is invalid? • Will the rules behave correctly when conditions change?
--	--

ServiceNow Incident
User Needs accurate, consistent and validated Incident records.

DOES • Creates and updates Incident records. • Changes field values and checks the form response. • Attempts form saves and list/cell edits during testing.	FEELS • Uncertain when requirements are not visible. • Frustrated by invalid or blocked updates. • More confident when the system gives clear validation.
--	--

PAINS • Confusion about which Incident fields are mandatory. • Invalid values may be entered or submitted. • Rules may behave differently during form editing and list editing. • Incorrect updates can require additional correction work.	GAINS • Clear field requirements at the right time. • Validation before an Incident is saved. • Consistent behaviour when conditions change. • Controlled list edits and more reliable Incident records.
--	---

Expected outcome: A ServiceNow Incident experience where UI behaviour and client-side validation are applied consistently across form changes, save actions and list edits.
