

Ideation Phase

Define the Problem Statements

Date: 03 October 2026

Team ID	SWTID-2026-4310
Project Name	Implement Client Script & UI Policy (Incident)
Program / Module	ServiceNow System Administrator
Maximum Marks	2 Marks

Customer Problem Statement Template:

Create a problem statement from the point of view of a ServiceNow user or administrator. The statement should focus on the practical difficulty faced while entering, editing, and validating Incident records, and should connect that difficulty to the need for UI Policies and Client Scripts.

A clear problem statement helps the team identify where form behaviour needs to be controlled, where fields must become mandatory or change dynamically, and where invalid Incident updates should be prevented before they are saved.

Reference format: Customer Problem Statement / PS-1 and PS-2

→ UI Policy & Action

→ Client Scripts → Validated
Incident

Incident Form

SkillWallet Project: Incident form control & validation workflow

Example:

Problem Statement (PS)

I am (Customer): a ServiceNow Incident user / support staff member.

I'm trying to: create and update Incident records correctly while entering the required information.

But: fields may not become mandatory or change their behaviour when the Incident conditions change, and users can attempt invalid saves or list edits.

Because: the Incident form does not automatically enforce all required field and validation rules without suitable UI Policies and Client Scripts.

Which makes me feel: uncertain about whether the Incident record is complete and frustrated when an update is rejected or incorrect information is entered.

Component	Purpose
UI Policy	Control Incident form behaviour based on conditions.
UI Policy Action	Apply the required behaviour to the Urgency field.
onChange Client Script	Dynamically respond when a field value changes.
onSubmit Client Script	Validate the form before the Incident is saved.
onCellEdit Client Script	Control or block invalid list-based edits.

Ideation Phase

Define the Problem Statements

Project: Implement Client Script & UI Policy (Incident)

PS-1

I am: a ServiceNow support user creating an Incident.

I'm trying to: enter Incident information and understand immediately which fields are required for the current situation.

But: the form may not automatically enforce the required state of fields when conditions change.

Because: the required form behaviour has to be configured using UI Policy and UI Policy Action rules. **Which makes me feel:** unsure whether I have completed the Incident correctly.

PS-2

I am: a ServiceNow administrator responsible for reliable Incident data entry.

I'm trying to: ensure Incident records are validated during field changes, form submission, and list editing.

But: users can enter values that need validation, attempt to save incomplete records, or modify records through list editing without the required checks.

Because: different user actions require different client-side controls such as onChange, onSubmit, and onCellEdit Client Scripts.

Which makes me feel: concerned about inconsistent Incident records and unnecessary correction work.

Testing & Enforcement Requirements

Test Area	Expected Project Behaviour
Mandatory field enforcement	Required field behaviour is applied correctly on the Incident form.
Form save validation	Invalid or incomplete submissions are prevented before save.
Reverse condition behaviour	UI Policy behaviour changes correctly when its condition becomes false.
List-edit blocking	Invalid cell/list edits are controlled using the onCellEdit script.
Form-based updates	Incident updates behave consistently with the configured client-side rules.

SkillWallet – ServiceNow System Administrator | Page 3

Project Outcome: Configure and test the Incident form so that UI behaviour, field requirements, save validation, and list editing follow the defined rules.

Note: The project-specific content above is adapted from the provided template structure and the project details supplied in the request.
