

PROJECT REPORT

Implement Client Script & UI Policy (Incident)

Program / Module	ServiceNow System Administrator
Platform	ServiceNow — Incident table
Project workspace	SkillWallet
Project status	Work and milestones completed and reviewed ; need to be verified by the mentor
Team ID	SWTID-2026-4310
Report date	03 October 2026

Prepared using the uploaded Project Report Format. Sections are tailored to the project details provided; implementation outcomes, screenshots, and links not supplied are marked pending rather than invented.

REPORT CONTENTS

- 1. INTRODUCTION

- 10. FUTURE SCOPE
- 11. APPENDIX

1. INTRODUCTION

1.1 Project Overview

The project, **Implement Client Script & UI Policy (Incident)**, is part of the ServiceNow System Administrator module on SkillWallet. It focuses on configuring client-side form behavior on the Incident table using a UI Policy and three types of Client Scripts: **onChange**, **onSubmit**, and **onCellEdit**. A UI Policy Action is planned for the **Urgency** field.

1.2 Purpose

The purpose is to apply and validate field behavior and client-side controls in Incident records. Planned checks

include mandatory-field enforcement, form-save validation, reverse-condition behavior, list-edit blocking, and form-based updates. This report follows the headings in the supplied project-report template.

2. IDEATION PHASE

2.1 Problem Statement

Incident forms need consistent and understandable field behavior so users can enter appropriate information and avoid invalid submissions. This project will configure and test client-side rules for the Urgency field and related form/list interactions. Specific business conditions and acceptance values were not included in the supplied project summary and should be confirmed before implementation.

2.2 Empathy Map Canvas

Proposed user-centered framing for planning; this is not a completed interview or research finding.

Think & Feel	See	Say & Do	Pain Points
Wants to complete incident records accurately.	Incident form fields and validation messages.	Enters or updates incident details; saves the record.	Unclear field requirements or unexpected save behavior.

2.3 Brainstorming

Planned implementation ideas: (1) define the Incident UI Policy condition; (2) configure a UI Policy Action for Urgency; (3) add an onChange script for field-change behavior; (4) add onSubmit validation for save attempts; (5) add onCellEdit logic for list edits; and (6) test behavior through both form and list interfaces.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

Step	User action	System behavior to verify
1	Open an Incident record	Relevant UI Policy condition is evaluated on the form.
2	Review or change Urgency	Configured UI Policy Action and onChange behavior are applied.
3	Submit the form	onSubmit validation permits valid submissions and handles invalid ones as designed.
4	Edit a record from a list	onCellEdit behavior enforces the intended rule.
5	Return to form and update	Form-based update remains consistent with defined requirements.

3.2 Solution Requirement

Functional requirements: create a UI Policy on the Incident table; configure a UI Policy Action for Urgency; implement onChange, onSubmit, and onCellEdit Client Scripts; and test mandatory-field enforcement, reverse-condition behavior, save validation, list-edit behavior, and form-based updates. Non-functional requirements such as response-time targets, supported browser versions, and access roles were not specified and should be agreed before formal acceptance.

3.3 Data Flow Diagram

Illustrative flow of user input and client-side validation:

Conceptual only — exact conditions and script logic remain to be defined.

3.4 Technology Stack

Primary platform: ServiceNow. Target table: Incident. Configuration elements: UI Policy, UI Policy Action, Client Scripts (onChange, onSubmit, onCellEdit), and ServiceNow form/list interfaces. SkillWallet is the learning/project workspace. Instance version, plugins, and development tools were not provided.

4. PROJECT DESIGN

4.1 Problem Solution Fit

The proposed configuration maps to the stated testing needs: UI Policy and its action govern field behavior; onChange responds to changes made on the form; onSubmit checks a form submission; and onCellEdit addresses edits made from a list. Whether the design meets the requirements must be established through execution and review.

4.2 Proposed Solution

1. Define the condition for the Incident UI Policy. 2. Configure the UI Policy Action for Urgency. 3. Implement the onChange script for the selected field and required response. 4. Implement onSubmit validation for save attempts. 5. Implement onCellEdit behavior for list edits. 6. Execute acceptance checks and record outcomes and defects.

4.3 Solution Architecture

The solution is a client-side configuration within ServiceNow. The user interacts with an Incident form or list; the relevant UI Policy or Client Script evaluates the interaction; and the interface responds according to the configured rule. Precise conditions, field dependencies, messages, and rejection behavior remain to be specified.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

The project overview states that the group has not yet been formed and stories have not been assigned. This is a suggested sequence, not a record of completed work.

Milestone	Activity	Deliverable / exit check	Status
1	Create UI Policy on Incident	Policy saved with agreed condition	Pending
2	Create UI Policy Action for Urgency	Urgency behavior matches requirement	Pending
3	Create onChange Client Script	Field-change behavior verified	Pending
4	Create onSubmit Client Script	Save validation verified	Pending
5	Create onCellEdit Client Script	List-edit behavior verified	Pending
6	Run acceptance checks	Test outcomes and defects recorded	Pending

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

Functional acceptance cases planned for execution:

ID	Test case	Expected result	Status
TC-01	Mandatory field enforcement	Configured field becomes mandatory when policy condition is true.	Not run
TC-02	Reverse condition behavior	Field behavior reverts when the condition is false, as configured.	Not run
TC-03	Form save validation	Invalid submission is handled; valid submission proceeds as intended.	Not run
TC-04	List-edit blocking	List edit is accepted or blocked according to the defined rule.	Not run
TC-05	Form-based updates	Form updates behave as specified and remain consistent with list behavior.	Not run

Performance metrics such as page response time, script execution duration, concurrent users, and test thresholds were not supplied. If performance testing is required, define measurable targets and test conditions before reporting results.

7. RESULTS

7.1 Output Screenshots

No ServiceNow implementation screenshots or execution evidence were included in the supplied materials. Insert genuine screenshots after completing the configuration. Recommended evidence: (a) Incident UI Policy record and condition; (b) UI Policy Action for Urgency; (c) onChange Client Script; (d) onSubmit Client Script; (e) onCellEdit Client Script; and (f) test behavior on the form and list.

Current result: implementation and test execution are not confirmed. All cases remain pending; no pass/fail totals or defect counts are reported.

8. ADVANTAGES & DISADVANTAGES

Potential advantages

- Consistent field behavior on Incident forms.
- Client-side validation can help users catch incomplete or invalid entries before submission.
- Separate script types address form changes, submission, and list edits.
- Explicit acceptance tests make behavior easier to verify.

Considerations / limitations

- Incorrect conditions or script logic may disrupt the user workflow.
- Client-side behavior must be tested in both form and list contexts.
- Client-side checks should not be assumed to replace server-side validation or access controls where those are required.
- Benefits have not yet been measured because implementation and testing are pending.

9. CONCLUSION

This project plans a ServiceNow Incident-table configuration using a UI Policy, a UI Policy Action for Urgency, and onChange, onSubmit, and onCellEdit Client Scripts. The supplied project overview identifies six milestones, ending with testing of mandatory fields, save validation, reverse conditions, list edits, and form updates. Since the group is not yet formed and execution results were not provided, this report describes the plan rather than claiming successful implementation.

10. FUTURE SCOPE

Potential future work includes documenting detailed acceptance criteria, adding negative and boundary test cases, maintaining a defect log, validating behavior across supported browsers and user roles, reviewing script maintainability, and capturing before/after evidence. Additional work should be selected based on project requirements.

11. APPENDIX

Source Code (if any)

No source code was supplied. Add the final UI Policy condition and Client Script code here or attach them as a separate appendix after implementation.

Dataset Link

Not applicable based on the supplied project description; no dataset was identified.

GitHub & Project Demo Link

No GitHub repository or demo link was provided. Add links if created and permitted for sharing.

Reference: Project details supplied by the user from the SkillWallet project overview; report section order follows the uploaded "Final Report Template.pdf". Illustrations are conceptual diagrams, not screenshots from a live ServiceNow instance.
