

Project Design Phase-II

Technology Stack (Architecture & Stack)

Date	03 October 2026
Team ID	SWTID-2026-4310
Project Name	Implement Client Script & UI Policy (Incident)
Program / Module	ServiceNow System Administrator – SkillWallet
Maximum Marks	4 Marks

Technical Architecture:

The architecture represents the application logic and technology blocks used to implement Client Scripts and UI Policies for the ServiceNow Incident table. The solution is primarily platform-based, with client-side behavior executed in the ServiceNow user interface and Incident data maintained by the ServiceNow platform.

Architectural considerations: application processes are represented as ServiceNow configuration and client-side logic; the Incident table is the primary data component; platform security/access controls protect records; the project does not require an external API or machine-learning model.

Table-1 : Components & Technologies

1	User Interface	Interface through which users create, view, edit and submit Incident records.	ServiceNow Incident Form, Incident List / List Editor
2	Application Logic-1	Controls Incident form behavior according to defined conditions.	UI Policy
3	Application Logic-2	Applies the UI Policy behavior to the Urgency field.	UI Policy Action
4	Application Logic-3	Responds to field changes and performs client-side save/list validation.	onChange, onSubmit and onCellEdit Client Scripts
5	Database	Stores Incident records and their field values within the platform.	ServiceNow Incident Table
6	Cloud Database	Platform-managed data service for the ServiceNow application.	ServiceNow Platform Data Layer
7	File Storage	No dedicated project file-storage component is required by the supplied project scope.	Not applicable

8	External API-1	No external API is specified for the project.	Not applicable
9	External API-2	No second external API is specified for the project.	Not applicable
10	Machine Learning Model	No machine-learning model is required for the Client Script/UI Policy implementation.	Not applicable
11	Infrastructure (Server / Cloud)	Application and configuration are delivered through the ServiceNow platform rather than a separately deployed project server.	ServiceNow Cloud Platform / Instance

Table-2: Application Characteristics

1	Open-Source Frameworks	The supplied project scope does not specify an external open-source framework. The implementation uses ServiceNow-native configuration and scripting capabilities.	ServiceNow UI Policies and Client Scripts
2	Security Implementations	Access and record protection are handled within the ServiceNow platform. Client-side validation supports correct user interaction but should complement platform-side access controls.	ServiceNow roles / ACLs and platform security controls
3	Scalable Architecture	The implementation is configuration-driven and can be extended with additional Incident fields, UI Policies and Client Scripts without changing the overall platform architecture.	ServiceNow platform configuration model
4	Availability	The application is accessed through the ServiceNow instance; the project does not specify separate load-balancing or distributed-server components.	ServiceNow hosted platform / instance
5	Performance	Client Scripts should execute only the required validation or field-behavior logic to keep Incident forms and list editing responsive.	Client-side JavaScript execution within ServiceNow

Implementation Flow

1. User interacts with the Incident form or list → 2. UI Policy evaluates the configured condition → 3. UI Policy Action controls the Urgency field → 4. onChange responds to field changes → 5. onSubmit validates the record before save → 6. onCellEdit validates list-based changes → 7. Incident data remains within the ServiceNow platform.
